

C++'s Standard Library (std)

Prof. Wade Fagen-Ulmschneider

I ILLINOIS

The C++ standard library (std) provides a set of commonly used functionality and data structures to build upon.

Standard Library Organization

The C++ standard library is organized into many separate sub-libraries that can be `#include`'d in any C++ program.

iostream

The iostream header includes operations for reading/writing to files and the console itself, including **std::cout**.

cpp-std/cout.cpp

```
8 #include <iostream>
9
10 int main() {
11     std::cout << "Hello, world!" << std::endl;
12     return 0;
13 }
```

Standard Library Organization

All functionality used from the standard library will be part of the **std** namespace.

- Namespaces allow us to avoid name conflicts for commonly used names.

If a feature from a namespace is used often, it can be imported into the global space with **using**:

```
using std::cout;
```

cpp-std/cout2.cpp

```
8 #include <iostream>
9
10 using std::cout;
11 using std::endl;
12
13 int main() {
14     cout << "Hello, world!" << endl;
15     return 0;
16 }
```

Adding Our Cube

cpp-std/main.cpp

```
8 #include <iostream>
9 #include "Cube.h"
10
11 int main() {
12     uiuc::Cube c;
13     c.setLength(2.4);
14     std::cout << "Volume: " << c.getVolume() << std::endl;
15
16     double surfaceArea = c.getSurfaceArea();
17     std::cout << "Surface Area: " << surfaceArea << std::endl;
18
19     return 0;
20 }
```

Using the uiuc Namespace

A “cube” is rather generic – hundreds of cube-based data structures exist!

We will be specific about our **Cube** and specify that our **Cube** is within the **uiuc** namespace!

cpp-std/Cube.h

```
8 #pragma once
9
10 namespace uiuc {
11     class Cube {
12     public:
13         double getVolume();
14         double getSurfaceArea();
15         void setLength(double length);
16
17     private:
18         double length_;
19     };
20 }
```

cpp-std/Cube.cpp

```
8 #include "Cube.h"
9
10 namespace uiuc {
11     double Cube::getVolume() {
12         return length_ * length_ * length_;
13     }
14
15     double Cube::getSurfaceArea() {
16         return 6 * length_ * length_;
17     }
18
19     void Cube::setLength(double length) {
20         length_ = length;
21     }
22 }
```
